### 6.1.3 Measurement uncertainty

The measurement uncertainties stated in this document are expressed as expanded uncertainty obtained by multiplying the standard uncertainty by the coverage factor  $K = 2$  corresponds to a confidence level of about 95%.

### 6.2 Test procedure

The pressure loss shall be measured with a differential sensor. The sensor of methods known further to calibration or by reference to other standards, providing measurements whose systematic does not exceed the maximum permissible values, shall be used.

The accuracy of measurement shall be

- Upstream pressure, differential pressure and flow rate  $\pm 2\%$  of the read value;
- Temperature measurement  $\pm 1^\circ\text{C}$
- Test fluid shall be water with a temperature between  $5^\circ\text{C}$  and  $40^\circ\text{C}$ .

A basic flow test facility is shown in Figure 9
